

Python Basics

1)Arithmetic Operators

```
a = 46 # Initializing the value of a
b = 4 # Initializing the value of b
print("For a =", a, "and b =", b, "\nCalculate the following:")
# printing different results
print('1. Addition of two numbers: a + b =', a + b)
print('2. Subtraction of two numbers: a - b =', a - b)
print('3. Multiplication of two numbers: a * b =', a * b)
print('4. Division of two numbers: a / b =', a / b)
print('5. Floor division of two numbers: a // b =', a // b)
print('6. Remainder of two numbers: a mod b =', a % b)
print('7. Exponent of two numbers: a ^ b =', a ** b)
```

For a = 46 and b = 4
Calculate the following:

1. Addition of two numbers: a + b = 50
2. Subtraction of two numbers: a - b = 42
3. Multiplication of two numbers: a * b = 184
4. Division of two numbers: a / b = 11.5
5. Floor division of two numbers: a // b = 11
6. Remainder of two numbers: a mod b = 2
7. Exponent of two numbers: a ^ b = 4477456

2)Comparison Operators

```
a = 46 # Initializing the value of a
b = 4 # Initializing the value of b

print("For a =", a, "and b =", b, "\nCheck the following:")

print('1. Two numbers are equal or not:', a == b)
print('2. Two numbers are not equal or not:', a != b)
print('3. a is less than or equal to b:', a <= b)
print('4. a is greater than or equal to b:', a >= b)
print('5. a is greater b:', a > b)
print('6. a is less than b:', a < b)
```

For a = 46 and b = 4

Check the following:

1. Two numbers are equal or not: False
2. Two numbers are not equal or not: True
3. a is less than or equal to b: False
4. a is greater than or equal to b: True
5. a is greater b: True
6. a is less than b: False

3)Assignment Operators

```
a = 34 # Initialize the value of a
b = 6 # Initialize the value of b
# printing the different results
print('a += b:', a + b)
print('a -= b:', a - b)
print('a *= b:', a * b)
print('a /= b:', a / b)
print('a %= b:', a % b)
print('a **= b:', a ** b)
print('a //= b:', a // b)
```

```
a += b: 40
a -= b: 28
a *= b: 204
a /= b: 5.666666666666667
a %= b: 4
a **= b: 1544804416
a //= b: 5
```

4)Bitwise Operators

```
a = 7 # initializing the value of a
b = 8 # initializing the value of b
# printing different results
print('a & b :', a & b)
print('a | b :', a | b)
print('a ^ b :', a ^ b)
print('~a :', ~a)
print('a << b :', a << b)
print('a >> b :', a >> b)
```

```
a & b : 0
a | b : 15
a ^ b : 15
~a : -8
a << b : 1792
a >> b : 0
```

5)Logical Operators

```
a = 7 # initializing the value of a
# printing different results
print("For a = 7, checking whether the following conditions are True or False:")
print('\a > 5 and a < 7" =>', a > 5 and a < 7)
print('\a > 5 or a < 7" =>', a > 5 or a < 7)
print('\a not (a > 5 and a < 7)" =>', not(a > 5 and a < 7))
```

```
For a = 7, checking whether the following conditions are True or False:
"a > 5 and a < 7" => False
"a > 5 or a < 7" => True
"not (a > 5 and a < 7)" => True
```

6)Membership Operators

```
# initializing a list
myList = [12, 22, 28, 35, 42, 49, 54, 65, 92, 103, 245, 874]
x = 31
y = 28
print("Given List:", myList)
if (x not in myList):
    print("x =", x, "is NOT present in the given list.")
else:
    print("x =", x, "is present in the given list.")
if (y in myList):
    print("y =", y, "is present in the given list.")
else:
    print("y =", y, "is NOT present in the given list.")
```

input

```
Given List: [12, 22, 28, 35, 42, 49, 54, 65, 92, 103, 245, 874]
x = 31 is NOT present in the given list.
y = 28 is present in the given list.
```

7)Identity Operators

```
a = ["Rose", "Lotus"]
b = ["Rose", "Lotus"]
c = a
print("a is c => ", a is c)
print("a is not c => ", a is not c)
print("a is b => ", a is b)
print("a is not b => ", a is not b)
print("a == b => ", a == b)
print("a != b => ", a != b)
```

```
a is c => True
a is not c => False
a is b => False
a is not b => True
a == b => True
a != b => False
```

Python Reverse of the string

1)Using for loop

```
def reverse_string(str):  
    str1 = "" # Declaring empty string to store the reversed string  
    for i in str:  
        str1 = i + str1  
    return str1 # It will return the reverse string to the caller function  
str = "JavaTpoint" # Given String  
print("The original string is: ",str)  
print("The reverse string is",reverse_string(str)) # Function call
```

```
The original string is: JavaTpoint  
The reverse string is tniopTavaJ
```

2)Using while loop

```
str = "JavaTpoint" # string variable  
print ("The original string is : ",str)  
reverse_String = "" # Empty String  
count = len(str) # Find length of a string and save in count variable  
while count > 0:  
    reverse_String += str[ count - 1 ] # save the value of str[count-1] in reverseString  
    count = count - 1 # decrement index  
print ("The reversed string using a while loop is : ",reverse_String)# reversed string
```

```
The original string is : JavaTpoint  
The reversed string using a while loop is : tniopTavaJ
```

input

3) Using the slice operator

```
def reverse(str):  
    str = str[::-1]  
    return str  
  
s = "JavaTpoint"  
print ("The original string is : ",s)  
print ("The reversed string using extended slice operator is : ",reverse(s))
```

```
input
The original string is : JavaTpoint
The reversed string using extended slice operator is : tniopTavaJ
```

4) Using reverse function with join

```
def reverse(str):
    string = "".join(reversed(str)) # reversed() function inside the join()
    return string

s = "JavaTpoint"

print ("The original string is : ",s)
print ("The reversed string using reversed() is : ",reverse(s) )
```

```
input
The original string is : JavaTpoint
The reversed string using reversed() is : tniopTavaJ
```

5)Using recursion()

```
def reverse(str):
    if len(str) == 0:
        return str
    else:
        return reverse(str[1:]) + str[0]

str = "Bhargava Ram"
print ("The original string is : ", str)
print ("The reversed string(using recursion) is : ", reverse(str))
```

```
input
The original string is : Bhargava Ram
The reversed string(using recursion) is : maR avagrahB
```

How to read CSV file in Python

```
import csv
with open(r'./example.csv') as csv_file:
    csv_read = csv.reader(csv_file, delimiter=',')
    count_line = 0
    for row in csv_read:
        if count_line == 0:
            print(f'Column names are {"", ".join(row)}')
            count_line += 1
        else:
            print(f'\t{row[0]} roll number is: {row[1]} and department is: {row[2]}')
            count_line += 1
    print(f'Processed {count_line} lines.')
```

```
[Running] python -u "c:\Users\Administrator\Desktop\1.PY"
Column names are Name , roll_no, department
    Bhargav roll number is: 1 and department is: CSD.
    samim roll number is: 2 and department is: IS.
    sahil roll number is: 3 and department is: AIML.
    parakram roll number is: 4 and department is: CSE.
    prabhakar roll number is: 5 and department is: IS1.
Processed 6 lines.
```

if statement

```
num = int(input("enter the number:"))
if num%2 == 0:
    print("The Given number is an even number")
```

```
enter the number:10
The Given number is an even number
```

```
a = int (input("Enter a: "));
b = int (input("Enter b: "));
c = int (input("Enter c: "));
if a>b and a>c:
    print ("From the above three numbers given a is largest");
if b>a and b>c:
    print ("From the above three numbers given b is largest");
if c>a and c>b:
    print ("From the above three numbers given c is largest");
```

▼ ↗ 📄 ⚙️ 📌

```
Enter a: 10
Enter b: 20
Enter c: 30
From the above three numbers given c is largest
```

if-else statement

```
age = int (input("Enter your age: "))
if age>=18:
    print("You are eligible to vote !!");
else:
    print("Sorry! you have to wait !!");
```

▼ ↗ 📄 ⚙️ 📌

```
Enter your age: 22
You are eligible to vote !!
```

```
num = int(input("enter the number:"))
if num%2 == 0:
    print("The Given number is an even number")
else:
    print("The Given Number is an odd number")
```

```
enter the number:43
The Given Number is an odd number
```

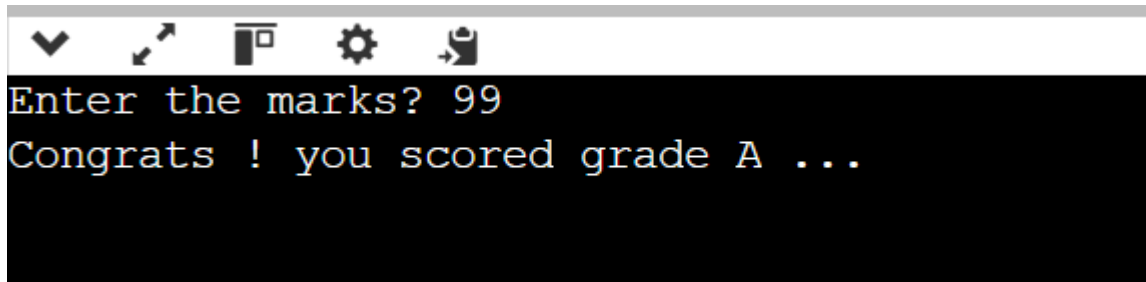

elif statement

```
number = int(input("Enter the number?"))
if number==10:
    print("The given number is equals to 10")
elif number==50:
    print("The given number is equal to 50");

    print("You scored grade B ...")
elif (marks > 30 and marks <= 40):
    print("You scored grade C ...")
else:
    print("Sorry you are fail ?")
```

```
Enter the marks? 99
Congrats ! you scored grade A ...
```

for Loop

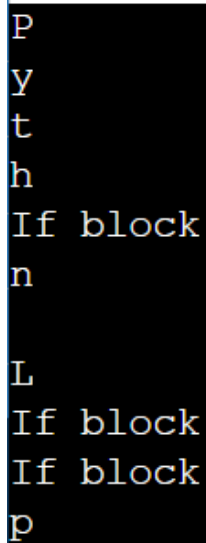

```
numbers = [4, 2, 6, 7, 3, 5, 8, 10, 6, 1, 9, 2]
square = 0
squares = []
for value in numbers:
    square = value ** 2
    squares.append(square)
print("The list of squares is", squares)
```

```
input
The list of squares is [16, 4, 36, 49, 9, 25, 64, 100, 36, 1, 81, 4]
```

Using else Statement with for Loop

```
string = "Python Loop"
for s in string:
    if s == "o":
        print("If block")
    else:
        print(s)
```

P
y
t
h
If block
n

L
If block
If block
p

```
tuple_ = (3, 4, 6, 8, 9, 2, 3, 8, 9, 7)
for value in tuple_:
    if value % 2 != 0:
        print(value)
        print("It is the odd numbers present in the tuple")
    else:
        print(value)
        print("It is the even numbers present in the tuple")
```

```
3
It is the odd numbers present in the tuple
4
It is the even numbers present in the tuple
6
It is the even numbers present in the tuple
8
It is the even numbers present in the tuple
9
It is the odd numbers present in the tuple
2
It is the even numbers present in the tuple
3
It is the odd numbers present in the tuple
8
It is the even numbers present in the tuple
9
It is the odd numbers present in the tuple
7
It is the odd numbers present in the tuple
```

The range() Function

```
print(range(15))
print(list(range(15)))
print(list(range(4, 9)))
print(list(range(5, 25, 4)))
```

```
range(0, 15)
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14]
[4, 5, 6, 7, 8]
[5, 9, 13, 17, 21]
```

```
tuple = ("Python", "Loops", "Sequence", "Condition", "Range")
for i in range(len(tuple)):
    print(tuple[i].upper())
```

```
PYTHON
LOOPS
SEQUENCE
CONDITION
RANGE
```

While Loop

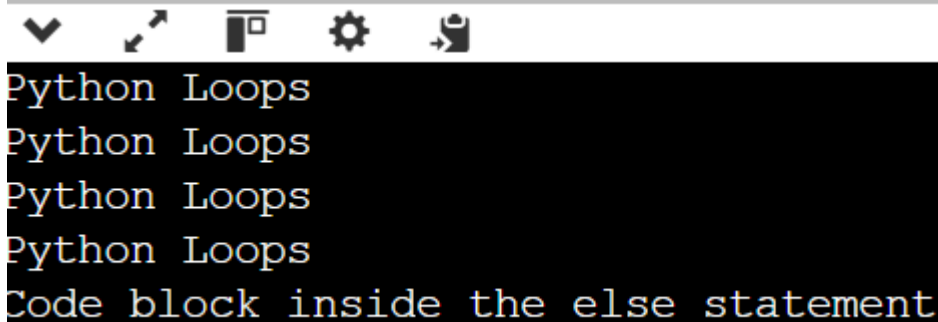

```
counter = 0
while counter < 10:
    counter = counter + 3
    print("Python Loops")
```

```
Python Loops
Python Loops
Python Loops
Python Loops
```

Using else Statement with while Loops

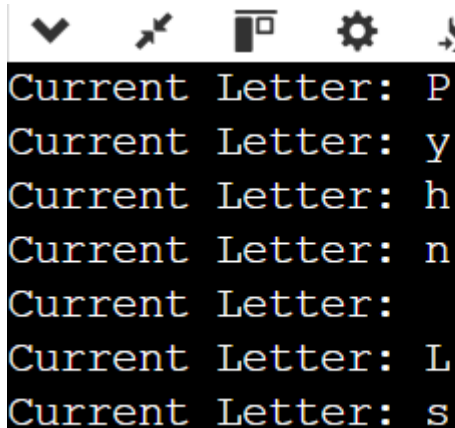

```
counter = 0
while (counter < 10):
    counter = counter + 3
    print("Python Loops") # Executed untile condition is met
else:
    print("Code block inside the else statement")
```

Current Letter:
```

Pass Statement

```
for string in "Python Loops":  
    pass  
print('Last Letter:', string)
```

```
Last Letter: s
```

Python for loop

```
numbers = [3, 5, 23, 6, 5, 1, 2, 9, 8]
sum_ = 0
for num in numbers:
    sum_ = sum_ + num ** 2
print("The sum of squares is: ", sum_)
```

```
The sum of squares is: 774
```

The range() Function

```
my_list = [3, 5, 6, 8, 4]
for iter_var in range( len( my_list ) ):
    my_list.append(my_list[iter_var] + 2)
print( my_list )
```

```
[3, 5, 6, 8, 4, 5, 7, 8, 10, 6]
```

Iterating by Using Index of Sequence

```
numbers = [3, 5, 23, 6, 5, 1, 2, 9, 8]
sum_ = 0
for num in range( len(numbers) ):
    sum_ = sum_ + numbers[num] ** 2
print("The sum of squares is: ", sum_)
```

```
The sum of squares is: 774
```

Using else Statement with for Loop

```
student_name_1 = 'Itika'
student_name_2 = 'Parker'
records = {'Itika': 90, 'Arshia': 92, 'Peter': 46}
def marks( student_name ):
    for a_student in records:
        if a_student == student_name:
            return records[ a_student ]
            break
        else:
            return f'There is no student of name {student_name} in the records'
print( f"Marks of {student_name_1} are: ", marks( student_name_1 ) )
print( f"Marks of {student_name_2} are: ", marks( student_name_2 ) )
```

input

Marks of Itika are: 90
Marks of Parker are: There is no student of name Parker in the records

Nested Loops

```
import random
numbers = [ ]
for val in range(0, 11):
    numbers.append( random.randint( 0, 11 ) )
for num in range( 0, 11 ):
    for i in numbers:
        if num == i:

16
17 # printing the tuple after update
18 print("After Changing the Element in Tuple...")
19 print("Tuple =", fruits_tuple)
```

Before Changing the Element in Tuple...  
Tuple = ('mango', 'orange', 'banana', 'apple', 'papaya')  
Converting banana => grapes  
After Changing the Element in Tuple...  
Tuple = ('mango', 'orange', 'grapes', 'apple', 'papaya')

## The len() Method

```
1 sampleTuple = (5, 3, 6, 1, 2, 8, 7, 9, 0, 4)
2
3 # printing the tuple for reference
4 print("Given Tuple =>", sampleTuple)
5
6 # using the len() method to find the length of the tuple
7 length_of_tuple = len(sampleTuple)
8
9 # printing the result for the users
10 print("Number of Elements in the Given Tuple =>", length_of_tuple)
```

Given Tuple => (5, 3, 6, 1, 2, 8, 7, 9, 0, 4)  
Number of Elements in the Given Tuple => 10

## Python Functions

### Illustration of a User-Defined Function

```
7
8 def square( num ):
9     """
10     This function computes the square of the number.
11     """
12     return num**2
13 object_ = square(6)
14 print( "The square of the given number is: ", object_ )
```

The square of the given number is: 36

## Calling a Function

```
1 def a_function( string ):
2     "This prints the value of length of string"
3     return len(string)
4
5 # Calling the function we defined
6 print( "Length of the string Functions is: ", a_function( "Functions" ) )
7 print( "Length of the string Python is: ", a_function( "Python" ) )
```

input

```
Length of the string Functions is: 9
Length of the string Python is: 6
```

## Pass by Reference vs. Pass by Value

```
1 def square( item_list ):
2     '''This function will find the square of items in the list'''
3     squares = [ ]
4     for l in item_list:
5         squares.append( l**2 )
6     return squares
7
8 # calling the defined function
9 my_list = [17, 52, 8];
10 my_result = square( my_list )
11 print( "Squares of the list are: ", my_result )
```

```
Squares of the list are: [289, 2704, 64]
```

## Function Arguments

### 1) Default Arguments

```
1 def function( n1, n2 = 20 ):
2     print("number 1 is: ", n1)
3     print("number 2 is: ", n2)
4
5
6 # Calling the function and passing only one argument
7 print( "Passing only one argument" )
8 function(30)
9
10 # Now giving two arguments to the function
11 print( "Passing two arguments" )
12 function(50,30)
```

```
Passing only one argument
number 1 is: 30
number 2 is: 20
Passing two arguments
number 1 is: 50
number 2 is: 30
```

### 2) Keyword Arguments

```
1 def function( n1, n2 ):
2     print("number 1 is: ", n1)
3     print("number 2 is: ", n2)
4
5     # Calling function and passing arguments without using keyword
6     print( "Without using keyword" )
7     function( 50, 30)
8
9     # Calling function and passing arguments using keyword
10    print( "With using keyword" )
11    function( n2 = 50, n1 = 30) |
```

Without using keyword  
number 1 is: 50  
number 2 is: 30  
With using keyword  
number 1 is: 30  
number 2 is: 50

### 3) Required Arguments

```
1 def function( n1, n2 ):
2     print("number 1 is: ", n1)
3     print("number 2 is: ", n2)
4
5     # Calling function and passing two arguments out of order, we need num1 to be 20 and num2 to be 30
6     print( "Passing out of order arguments" )
7     function( 30, 20 )
8
9     # Calling function and passing only one argument
10    print( "Passing only one argument" )
11    try:
12        function( 30 )
13    except:
14        print( "Function needs two positional arguments" ) |
```

Passing out of order arguments  
number 1 is: 30  
number 2 is: 20  
Passing only one argument  
Function needs two positional arguments

### 4) Variable-Length Arguments

```
1 def function( *args_list ):
2     ans = []
3     for l in args_list:
4         ans.append( l.upper() )
5     return ans
6
7     # Passing args arguments
8     object = function('Python', 'Functions', 'tutorial')
9     print( object )
10
11    # defining a function
12    def function( **kargs_list ):
13        ans = []
14        for key, value in kargs_list.items():
15            ans.append([key, value])
16        return ans
17
18    # Passing kwargs arguments
19    object = function(First = "Python", Second = "Functions", Third = "Tutorial")
20    print(object)
```

['PYTHON', 'FUNCTIONS', 'TUTORIAL']  
[['First', 'Python'], ['Second', 'Functions'], ['Third', 'Tutorial']]

## return Statement

```
1 def square( num ):
2     return num**2
3
4 # Calling function and passing arguments.
5 print( "With return statement" )
6 print( square( 52 ) )
7
8 # Defining a function without return statement
9 def square( num ):
10     num**2
11
12 # Calling function and passing arguments.
13 print( "Without return statement" )
14 print( square( 52 ) )
```

With return statement  
2704  
Without return statement  
None

## The Anonymous Functions

```
1 lambda_ = lambda argument1, argument2: argument1 + argument2;
2
3 # Calling the function and passing values
4 print( "Value of the function is : ", lambda_( 20, 30 ) )
5 print( "Value of the function is : ", lambda_( 40, 50 ) )
```

Value of the function is : 50  
Value of the function is : 90

## Scope and Lifetime of Variables

```
1 def number( ):
2     num = 50
3     print( "Value of num inside the function: ", num)
4
5 num = 10
6 number()
7 print( "Value of num outside the function:", num)
```

Value of num inside the function: 50  
Value of num outside the function: 10

## Python Capability inside Another Capability

```
1 def word():
2     string = 'Python functions tutorial'
3     x = 5
4     def number():
5         print( string )
6         print( x )
7     number()
8 word()
```

Python functions tutorial  
5

## Python Built-in Functions

### Python abs() Function

```
1 integer = -20
2 print('Absolute value of -40 is:', abs(integer))
3
4 # floating number
5 floating = -20.83
6 print('Absolute value of -40.83 is:', abs(floating))
```

Absolute value of -40 is: 20  
Absolute value of -40.83 is: 20.83

### Python all() Function

#### Python all() Function Example

```
1 k = [1, 3, 4, 6]
2 print(all(k))
3
4 # all values false
5 k = [0, False]
6 print(all(k))
7
8 # one false value
9 k = [1, 3, 7, 0]
10 print(all(k))
11
12 # one true value
13 k = [0, False, 5]
14 print(all(k))
15
16 # empty iterable
17 k = []
18 print(all(k))
```

True  
False  
False  
False  
True

### Python bin() Function

```
1 x = 10
2 y = bin(x)
3 print(y)
```

0b1010

### Python bool()

```
1 test1 = []
2 print(test1, 'is', bool(test1))
3 test1 = [0]
4 print(test1, 'is', bool(test1))
5 test1 = 0.0
6 print(test1, 'is', bool(test1))
7 test1 = None
8 print(test1, 'is', bool(test1))
9 test1 = True
10 print(test1, 'is', bool(test1))
11 test1 = 'Easy string'
12 print(test1, 'is', bool(test1))
```

[] is False  
[0] is True  
0.0 is False  
None is False  
True is True  
Easy string is True

### Python compile() Function

```
1 code_str = 'x=5\ny=10\nprint("sum =",x+y)'
2 code = compile(code_str, 'sum.py', 'exec')
3 print(type(code))
4 exec(code)
5 exec(x)
```

<class 'code'>  
sum = 15

### Python exec() Function

```
1 x = 8
2 exec('print(x==8)')
3 exec('print(x+4)')
```

True  
12

## Python any() Function

```
1 l = [4, 3, 2, 0]
2 print(any(l))
3
4 l = [0, False]
5 print(any(l))
6
7 l = [0, False, 5]
8 print(any(l))
9
10 l = []
11 print(any(l))
```

True  
False  
True  
False

## Python float()

```
1 # for integers
2 print(float(9))
3
4 # for floats
5 print(float(8.19))
6
7 # for string floats
8 print(float("-24.27"))
9
10 # for string floats with whitespaces
11 print(float("    -17.19\n"))
12
13 # string float error
14 print(float("xyz"))
```

9.0  
8.19  
-24.27  
-17.19  
Traceback (most recent call last):  
 File "/home/main.py", line 14, in <module>  
 print(float("xyz"))

ValueError: could not convert string to float: 'xyz'

## Python format() Function

```
1 # d, f and b are a type
2
3 # integer
4 print(format(123, "d"))
5
6 # float arguments
7 print(format(123.4567898, "f"))
8
9 # binary format
10 print(format(12, "b"))
```

123  
123.456790  
1100

### Python hasattr() Function

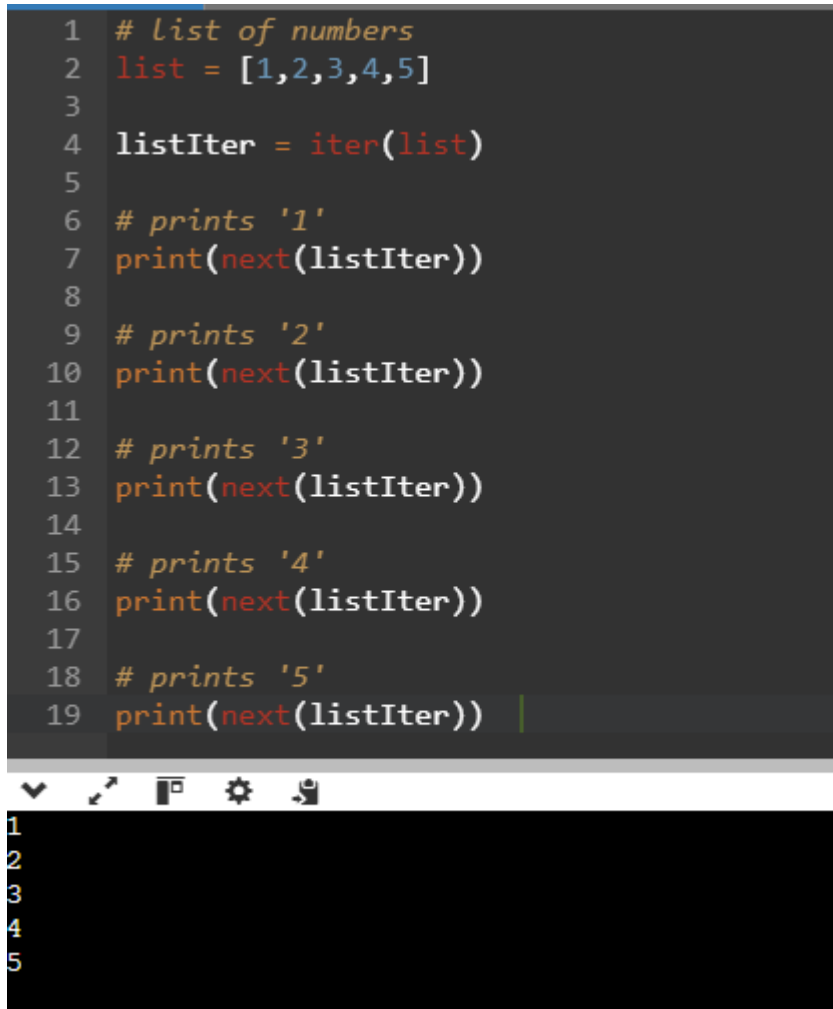

```
1 l = [4, 3, 2, 0]
2 print(any(l))
3
4 l = [0, False]
5 print(any(l))
6
7 l = [0, False, 5]
8 print(any(l))
9
10 l = []
11 print(any(l))
```

True  
False  
True  
False

### Python iter() Function Example

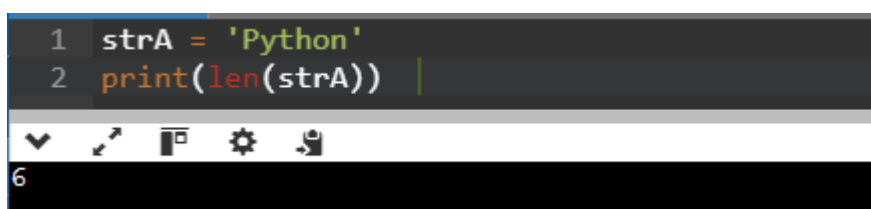

```
1 # list of numbers
2 list = [1,2,3,4,5]
3
4 listIter = iter(list)
5
6 # prints '1'
7 print(next(listIter))
8
9 # prints '2'
10 print(next(listIter))
11
12 # prints '3'
13 print(next(listIter))
14
15 # prints '4'
16 print(next(listIter))
17
18 # prints '5'
19 print(next(listIter))
```

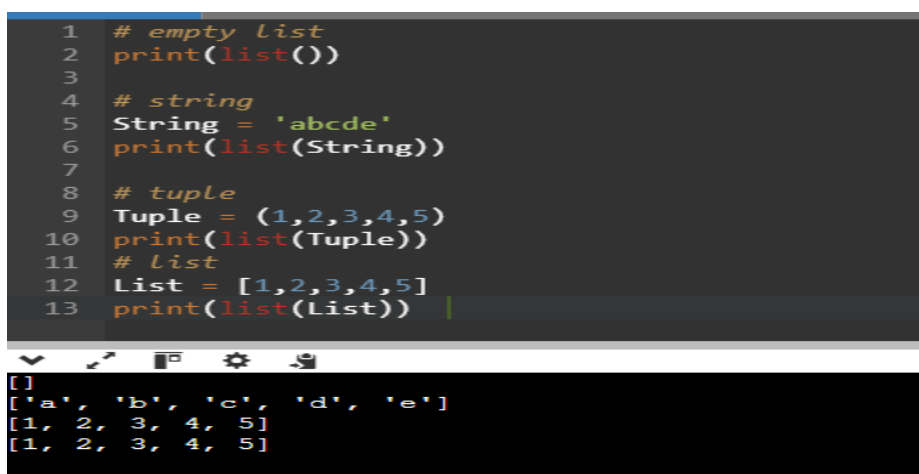

## Python len() Function

```
1 strA = 'Python'
2 print(len(strA))
```

## Python list()

```
1 # empty list
2 print(list())
3
4 # string
5 String = 'abcde'
6 print(list(String))
7
8 # tuple
9 Tuple = (1,2,3,4,5)
10 print(list(Tuple))
11 # list
12 List = [1,2,3,4,5]
13 print(list(List))
```

## Python memoryview() Function

```
1 #A random bytearray
2 randomByteArray = bytearray('ABC', 'utf-8')
3
4 mv = memoryview(randomByteArray)
5
6 # access the memory view's zeroth index
7 print(mv[0])
8
9 # It create byte from memory view
10 print(bytes(mv[0:2]))
11
12 # It create list from memory view
13 print(list(mv[0:3]))
```

```
65
b'AB'
[65, 66, 67]
```

## Python object()

```
1 python = object()
2
3 print(type(python))
4 print(dir(python))
```

```
<class 'object'>
['_class_', '_delattr_', '_dir_', '_doc_', '_eq_', '_format_', '_ge_', '_getattr_', '_getstate_', '_gt_', '_hash_', '_init_', '_init_subc', '_le_', '_lt_', '_ne_', '_new_', '_reduce_', '_reduce_ex_', '_repr_', '_setattr_', '_sizeof_', '_str_', '_subclasshook_']
```

## Python hash() Function

```
1 # Calling function
2 result = hash(21) # integer value
3 result2 = hash(22.2) # decimal value
4 # Displaying result
5 print(result)
6 print(result2)
```

```
21
461168601842737174
```

## Python pow() Function

```
1 # positive x, positive y (x**y)
2 print(pow(4, 2))
3
4 # negative x, positive y
5 print(pow(-4, 2))
6
7 # positive x, negative y (x**-y)
8 print(pow(4, -2))
9
10 # negative x, negative y
11 print(pow(-4, -2))
```

```
16
16
0.0625
0.0625
```

## Python reversed() Function

```
1 # for string
2 String = 'Java'
3 print(list(reversed(String)))
4
5 # for tuple
6 Tuple = ('J', 'a', 'v', 'a')
7 print(list(reversed(Tuple)))
8
9 # for range
10 Range = range(8, 12)
11 print(list(reversed(Range)))
12
13 # for list
14 List = [1, 2, 7, 5]
15 print(list(reversed(List)))
```

```
['a', 'v', 'a', 'J']
['a', 'v', 'a', 'J']
[11, 10, 9, 8]
[5, 7, 2, 1]
```

## Python isinstance() Function

```
1 class Rectangle:
2     def __init__(rectangleType):
3         print('Rectangle is a ', rectangleType)
4
5 class Square(Rectangle):
6     def __init__(self):
7         Rectangle.__init__('square')
8
9 print(isinstance(Square, Rectangle))
10 print(isinstance(Square, list))
11 print(isinstance(Square, (list, Rectangle)))
12 print(isinstance(Rectangle, (list, Rectangle)))
```

```
True
False
True
True
```

## Python tuple() Function

```
1 t1 = tuple()
2 print('t1=', t1)
3
4 # creating a tuple from a list
5 t2 = tuple([1, 6, 9])
6 print('t2=', t2)
7
8 # creating a tuple from a string
9 t1 = tuple('Java')
10 print('t1=',t1)
11
12 # creating a tuple from a dictionary
13 t1 = tuple({4: 'four', 5: 'five'})
14 print('t1=',t1) |
```

t1= ()  
t2= (1, 6, 9)  
t1= ('J', 'a', 'v', 'a')  
t1= (4, 5)

## Python zip() Function

```
1 numList = [4,5, 6]
2 strList = ['four', 'five', 'six']
3
4 # No iterables are passed
5 result = zip()
6
7 # Converting iterator to list
8 resultList = list(result)
9 print(resultList)
10
11 # Two iterables are passed
12 result = zip(numList, strList)
13
14 # Converting iterator to set
15 resultSet = set(result)
16 print(resultSet) |
```

[]  
{(6, 'six'), (5, 'five'), (4, 'four')}

## Python Lambda Functions

```
1 add = lambda num: num + 4
2 print( add(6) ) |
```

10

```

1 def add( num ):
2     return num + 4
3 print( add(6) )

```

10

```

1 a = lambda x, y : (x * y)
2 print(a(4, 5))

```

10

```

1 a = lambda x, y, z : (x + y + z)
2 print(a(4, 5, 5))

```

14

What's the Distinction Between Lambda and Def Functions?

```

1 def reciprocal( num ):
2     return 1 / num
3
4 lambda_reciprocal = lambda num: 1 / num
5
6 # using the function defined by def keyword
7 print( "Def keyword: ", reciprocal(6) )
8
9 # using the function defined by lambda keyword
10 print( "Lambda keyword: ", lambda_reciprocal(6) )

```

14

Using Lambda Function with filter()

```

1 list_ = [35, 12, 69, 55, 75, 14, 73]
2 odd_list = list(filter( lambda num: (num % 2 != 0) , list_ ))
3 print('The list of odd number is:', odd_list)

```

The list of odd number is: [35, 69, 55, 75, 73]

Using Lambda Function with map()

```

1 numbers_list = [2, 4, 5, 1, 3, 7, 8, 9, 10]
2 squared_list = list(map( lambda num: num ** 2 , numbers_list ))
3 print( 'Square of each number in the given list:' ,squared_list )

```

Square of each number in the given list: [4, 16, 25, 1, 9, 49, 64, 81, 100]

## Using Lambda Function with List Comprehension

```

1 squares = [lambda num = num: num ** 2 for num in range(0, 11)]
2 for square in squares:
3     print('The square value of all numbers from 0 to 10:',square(), end = " ")

```

The square value of all numbers from 0 to 10: 0 The square value of all numbers from 0 to 10: 1 The square value of all numbers from 0 to 10: 4 The square value of all numbers from 0 to 10: 9 The square value of all numbers from 0 to 10: 16 The square value of all numbers from 0 to 10: 25 The square value of all numbers from 0 to 10: 36 The square value of all numbers from 0 to 10: 49 The square value of all numbers from 0 to 10: 64 The square value of all numbers from 0 to 10: 81 The square value of all numbers from 0 to 10: 100

## Using Lambda Function with if-else

```

1 Minimum = lambda x, y : x if (x < y) else y
2 print('The greater number is:', Minimum( 35, 74 ))

```

The greater number is: 35

## Using Lambda with Multiple Statements

```

1 my_list = [ [3, 5, 8, 6], [23, 54, 12, 87], [1, 2, 4, 12, 5] ]
2 # sorting every sublist of the above list
3 sort_list = lambda num : ( sorted(n) for n in num )
4 # Getting the third largest number of the sublist
5 third_Largest = lambda num, func : [ l[ len(l) - 2] for l in func(num)]
6 result = third_Largest( my_list, sort_list)
7 print('The third largest number from every sub list is:', result )

```

The third largest number from every sub list is: [6, 54, 5]

## Python Modules

```

python > main_program.py
1 import example_module
2 result = example_module.square( 4 )
3 print("By using the module square of number is:",result)

```

PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL PORTS Code

[Running] python -u "c:\Users\Administrator\Desktop\python\main\_program.py"

By using the module square of number is: 16

[Done] exited with code=0 in 0.716 seconds

## Importing and also Renaming

```
1 import math
2 print( "The value of euler's number is", math.e )
```

The value of euler's number is 2.718281828459045

## Python from...import Statement

```
1 from math import e, tau
2 print( "The value of tau constant is: ", tau )
3 print( "The value of the euler's number is: ", e )
```

The value of tau constant is: 6.283185307179586  
The value of the euler's number is: 2.718281828459045

## Import all Names - From import \* Statement

```
1 from math import *
2 # Here, we are accessing functions of math module without using the dot operator
3 print( "Calculating square root: ", sqrt(25) )
4 # here, we are getting the sqrt method and finding the square root of 25
5 print( "Calculating tangent of an angle: ", tan(pi/6) )
```

Calculating square root: 5.0  
Calculating tangent of an angle: 0.5773502691896257

## Locating Path of Modules

```
1 import sys
2 # Here, we are printing the path using sys.path
3 print("Path of the sys module in the system is:", sys.path)
```

Path of the sys module in the system is: ['/', '/usr/lib/python3.12.zip', '/usr/lib/python3.12', '/usr/lib/python3.12/lib-dynload', '/usr/local/lib/python3.12/dist-packages', '/usr/lib/python3/dist-packages']

## The dir() Built-in Function

```
1 print( "List of functions:\n ", dir( str ), end="," )
```

List of functions: ['\_', 'add', 'class', 'contains', 'delattr', 'dir', 'doc', 'eq', 'format', 'ge', 'getattr', 'getitem', 'getnewargs', 'getstate', 'gt', 'hash', 'init', 'init\_subclass', 'iter', 'le', 'len', 'lt', 'mod', 'mul', 'ne', 'new', 'reduce', 'reduce\_ex', 'repr', 'rmod', 'rmul', 'setattr', 'sizeof', 'str', 'subclasshook', 'capitalize', 'casefold', 'center', 'count', 'encode', 'endswith', 'expandtabs', 'find', 'format', 'format\_map', 'index', 'isalnum', 'isalpha', 'isascii', 'isdecimal', 'isdigit', 'isidentifier', 'islower', 'isnumeric', 'isprintable', 'isspace', 'istitle', 'isupper', 'join', 'ljust', 'lower', 'lstrip', 'maketrans', 'partition', 'removeprefix', 'removesuffix', 'replace', 'rfind', 'rindex', 'rjust', 'rpartition', 'rsplit', 'rstrip', 'split', 'splitlines', 'startswith', 'strip', 'swapcase', 'title', 'translate', 'upper', 'zfill']

## Namespaces and Scoping

```
1 Number = 204
2 def AddNumber(): # here, we are defining a function with the name Add Number
3     # Here, we are accessing the global namespace
4     global Number
5     Number = Number + 200
6     print("The number is:", Number)
7 # here, we are printing the number after performing the addition
8 AddNumber() # here, we are calling the function
9 print("The number is:", Number)
```

The number is: 204  
The number is: 404
